Growing Primula (Primrose)

**Latin Name Pronunciation:** prim'yew-la

Plant all varieties except *P. x pubescens* in partial shade or shade; *P. x pubescens* grows best in full sun or partial shade here in Litchfield, CT. In cool coastal climates in the West, all Primroses can grow either in full sun or partial shade.

*P. x bulleesiana* will thrive in boggy soil. *P. x pubescens* demands good drainage and prefers to be kept on the dry side in summer. The other Primroses we offer require moisture-retentive soil that drains well but must not be allowed to dry out.

Slugs may chew holes in the leaves; see "least toxic control" for suggested remedies.
